

CLAIMS:

1. A method of motion-compensated interpolation of a data-signal, which data-signal comprises successive images wherein each image comprises groups of pixels, the method comprising:

generating (18) motion vectors, each motion vector corresponding to a group of pixels of one image, between a group of pixels of said one image and a second group of pixels of another image in the data-signal;

generating (16) interpolated results as a function of these motion vectors;

estimating (20) the reliability of each motion vector corresponding to a particular group of pixels;

calculating (20) weights as a function of the reliability of the motion vectors;

and

generating (20) an interpolated luminous intensity of a group of pixels for an interpolated image by calculating, on the basis of these weights, a weighted average of the interpolated results.

2. A method according to claim 1, wherein the interpolated luminous intensity of a group of pixels is calculated according to:

$$I^{k+\Delta}(\vec{x}) = (\sum_{m=1, \dots, M} \{w_m^k(\vec{x}) * i^{k+\Delta}_m(\vec{x})\}) / \sum_{m=1, \dots, M} \{w_m^k(\vec{x})\}, \quad (\text{A})$$

wherein $I^{k+\Delta}(\vec{x})$ is the interpolated luminous intensity of the group of pixels of an interpolated image $F^{k+\Delta}$, wherein the location of the group of pixels in the image is defined by the integer two-dimensional vector \vec{x} and where the real value Δ defines the place of the interpolated image $F^{k+\Delta}$ in the image sequence F^n , $n=1, 2, \dots, k, k+1, \dots, N$, wherein $\sum_{m=1, \dots, M} \{ \cdot \}$ is a summation from 1 to M over its argument $\{ \cdot \}$ and where $w_m^k(\vec{x})$ is a weight corresponding to the m^{th} interpolation result $i^{k+\Delta}_m(\vec{x})$:

$$i^{k+\Delta}_m(\vec{x}) = \text{median} \{ (I^k(\text{round} \{ \vec{x} - \Delta * \vec{D}_m^k(\vec{x}) \}) , (I^k(\vec{x}) + I^{k+1}(\vec{x}))/2) \}, \quad (\text{B})$$

$$(I^{k+1}(\text{round}\{\bar{x} + (1 - \Delta) * \bar{D}_m^k(\bar{x})\})),$$

wherein $\text{median}\{.\}$ is a function which gives the median value of its input arguments and $\text{round}\{.\}$ is a function which gives the nearest integer value to each component of its input argument, and wherein $I^k(\bar{x})$ is a luminous intensity of the group of pixels at location \bar{x} of the image F^k and wherein $\bar{D}_m^k(\bar{x})$ is the m^{th} two-dimensional integer motion vector, which is normalised between two successive images, of the M motion vectors which correspond to the group of pixels at location \bar{x} and wherein the weight $w_m^k(\bar{x})$ is a function of the reliability of the motion vector $\bar{D}_m^k(\bar{x})$.

3. A method according to claim 2, wherein the reliability of the motion vector $\bar{D}_m^k(\bar{x})$ is a function of the difference between the luminous intensities $I^k(\bar{x})$ and $I^{k+1}(\bar{x} + \bar{D}_m^k(\bar{x}))$ and wherein the reliability is also a function of the relative frequency of occurrence of $\bar{D}_m^k(\bar{x})$ in the neighborhood of the location \bar{x} in the image F^k .

4. A method according to claim 1, wherein the generation of interpolated luminous intensities according to the invention is only performed in those parts of the images of the data-signal where edges in the motion vector field of the images are located.

5. A method according to claim 4, wherein the method comprises a step of edge detection, wherein an edge in the motion vector field of image F^k is detected if at least one of the inequalities (C1) and (C2) is satisfied:

$$\|[\bar{D}_q^k(\bar{x} - \bar{K})]_1 - [\bar{D}_q^k(\bar{x} + \bar{K})]_1\| > T, \quad (\text{C1})$$

$$\|[\bar{D}_q^k(\bar{x} - \bar{K})]_2 - [\bar{D}_q^k(\bar{x} + \bar{K})]_2\| > T, \quad (\text{C2})$$

where q is a pre-determined integer value and wherein $\|.\|$ is a function which yields the absolute value of its input argument, $[.]_p$ is a function which yields the p^{th} component of its vector input argument, where T is a pre-determined fixed real value threshold and wherein \bar{K} is a vector which is given with:

$$\vec{K} = (K_1; K_2)^T, \quad (\text{D})$$

where K_1 and K_2 are integer values.

- 5 6. A device for motion-compensated interpolation of a data-signal, which data-signal comprises successive images wherein each image comprises groups of pixels, the device comprising:
- means (18) for generating motion vectors, each motion vector corresponding to a group of pixels of one image, between a group of pixels of said one image and a second
- 10 group of pixels of another image in the data-signal;
- means (16) for generating interpolated results as a function of these motion vectors;
- means (20) for estimating the reliability of each motion vector corresponding to a particular group of pixels;
- 15 means (20) for calculating weights as a function of the reliability of the motion vectors; and
- means (20) for generating interpolated luminous intensities of groups of pixels by calculating, on the basis of these weights, weighted averages of the interpolated results.
- 20 7. A picture signal display apparatus, comprising:
- means (12) for receiving a data-signal, which data-signal comprises successive images wherein each image comprises groups of pixels;
- a device (10) for motion-compensated interpolation of said data-signal, as claimed in claim 6;
- 25 means for generating at least one interpolated image on the basis of said interpolated luminous intensities; and
- means (D) for displaying the at least one interpolated image.
